

Approx.
38 cm

Toxic barrel showing tube and oozing fluids. The barrels at competition may not be exactly as that shown but are of the same type and approximate height. The height of the tube is not exactly known but may be 10 to 15 cm in height. There are no obstructions inside the tube. You can insert a probe inside the tube, if you wish. The tube is attached to an inner flexible bladder. The bladder does collapse as fluid is pumped out of it. See sketch previously posted.
